

Wilton's® Red Jonaprince

Parent plants

Jonagold colour mutant.

Origin

Discovered at the fruit cultivation farm Gebr. Princen in Weert, the Netherlands; 1994. In a selection of the Jonagold mutant 'Jonagold Princen'.

Growth

When young – rather vigorous, later moderate, favourable horizontal branch arrangement.

Flowering

Mid-season. Triploid. Somewhat self-tolerant, however cross-pollination is required. Recommended pollinators are: Braeburn, Cox, Delcorf, Elstar, Gala, Golden Delicious, Idared, Junami, Pinova, Wellant, Malus Golden Gem, Malus Golden Hornet and Malus Professor Sprenger.

Productivity

Excellent, early and regular. Requires little pruning, has a slight tendency to biennial bearing.

Harvesting

Third week of September, harvesting once only.

Appearance

Large fruits, even deep red colour.

Quality

Red Jonaprince has a very high hardness. Based on the favourable sweet/sour content of the fruits, very tasty.

Storage life

When cooled, the apples can be stored until the beginning of January; in ULO-storage up to the end of July. Excellent shelf life.

Details

Due to the early colouring, the Red Jonaprince can be harvested in one harvest period. However, harvesting must not be too early as this will result in a negative influence on the taste. Red Jonaprince fruits contain an extreme high level of the healthy substance anthocyan.
